The best way to cut engine operating costs!

The Return On Investment (R.O.I.) Multiplier

How CENTRI™ Air Precleaners cut costs!

1. Dirty air enters the CENTRI™ which is clamped onto your equipment's air intake pipe.
2. Specially designed vanes, curved and angled to precisely direct air flow, move the dirty air toward the stainless steel impeller.
3. The dynamically balanced, one piece spinning impeller (the only moving part) creates a tornado inside the housing.
4. The centrifugal force of the tornado expels the heavier-than-air dirt particles, chaff, dust, snow, rain, etc., out the discharge louver.
5. Cleaned air enters the engine intake pipe, and the filter element has only the very light particles to remove.

Note that there are no external piping, evacuator valves, bowls, braces or brackets, which can malfunction and affect the efficiency of the CENTRI™ Precleaner.

The results?

- Cleaner Air for your Equipment!
- Longer Filter Element Life!
- Increased Engine Life!
- Increased Engine Performance!
- Reduced Operating Costs!

CUBIC FEET PER MINUTE (C.F.M.) OF AIR FORMULA

For all engines the C.F.M. can be determined by using the following formula: engines equipped with twin air intake pipes, divide the engine C.F.M. by two and apply the proper CENTRI™ Precleaner to each of the pipes.

2 CYCLE ENGINES

$$\text{C.F.M.} = \frac{\text{C.I.D.} \times \text{R.P.M.} \times \text{Vol. Eff.}}{1728}$$

4 CYCLE ENGINES

$$\text{C.F.M.} = \frac{\text{C.I.D.} \times \text{R.P.M.} \times \text{Vol. Eff.}}{3456}$$

C.I.D. - Cubic Inch Displacement R.P.M. - Revolutions per Minute Vol. Eff. - Volume Efficiency

To convert Metric Displacements to C.I.D. for use in the formulas, use the following conversion factors:
 Displacement in Cubic Centimeters (cm³) x 0.06102 = C.I.D.
 Displacement in Liters x 61.02 = C.I.D.
